

**Anti-p38 MAPK MAPK14 Rabbit Monoclonal Antibody**  
**Catalog # ABO13925****Specification**

---

**Anti-p38 MAPK MAPK14 Rabbit Monoclonal Antibody - Product Information**

Application	WB, IHC, IF, ICC
Primary Accession	<a href="#">Q16539</a>
Host	Rabbit
Isotype	Rabbit IgG
Reactivity	Rat, Human, Mouse
Clonality	Monoclonal
Format	Liquid

**Description**

Anti-p38 MAPK MAPK14 Rabbit Monoclonal Antibody . Tested in WB, IHC, ICC/IF applications. This antibody reacts with Human, Mouse, Rat.

**Anti-p38 MAPK MAPK14 Rabbit Monoclonal Antibody - Additional Information**

**Gene ID** 1432

**Other Names**

Mitogen-activated protein kinase 14, MAP kinase 14, MAPK 14, 2.7.11.24, Cytokine suppressive anti-inflammatory drug-binding protein, CSAID-binding protein, CSBP, MAP kinase MXI2, MAX-interacting protein 2, Mitogen-activated protein kinase p38 alpha, MAP kinase p38 alpha, Stress-activated protein kinase 2a, SAPK2a, MAPK14 ([HGNC:6876](http://www.genenames.org/cgi-bin/gene_symbol_report?hgnc_id=6876))

**Calculated MW**

41293 MW KDa

**Application Details**

WB 1:500-1:2000<br>IHC 1:50-1:200<br>ICC/IF 1:50-1:200

**Subcellular Localization**

Cytoplasm. Nucleus.

**Tissue Specificity**

Brain, heart, placenta, pancreas and skeletal muscle. Expressed to a lesser extent in lung, liver and kidney.

**Contents**

Rabbit IgG in phosphate buffered saline, pH 7.4, 150mM NaCl, 0.02% sodium azide and 50% glycerol, 0.4-0.5mg/ml BSA.

**Immunogen**

A synthesized peptide derived from human p38 MAPK

**Purification**

Affinity-chromatography

Storage

**Store at -20°C for one year. For short term storage and frequent use, store at 4°C for up to one month. Avoid repeated freeze-thaw cycles.****Anti-p38 MAPK MAPK14 Rabbit Monoclonal Antibody - Protein Information****Name** MAPK14 ([HGNC:6876](#))**Function**

Serine/threonine kinase which acts as an essential component of the MAP kinase signal transduction pathway. MAPK14 is one of the four p38 MAPKs which play an important role in the cascades of cellular responses evoked by extracellular stimuli such as pro-inflammatory cytokines or physical stress leading to direct activation of transcription factors. Accordingly, p38 MAPKs phosphorylate a broad range of proteins and it has been estimated that they may have approximately 200 to 300 substrates each. Some of the targets are downstream kinases which are activated through phosphorylation and further phosphorylate additional targets. RPS6KA5/MSK1 and RPS6KA4/MSK2 can directly phosphorylate and activate transcription factors such as CREB1, ATF1, the NF-kappa-B isoform RELA/NFKB3, STAT1 and STAT3, but can also phosphorylate histone H3 and the nucleosomal protein HMGN1 (PubMed:<a href="http://www.uniprot.org/citations/9687510" target="\_blank">9687510</a>, PubMed:<a href="http://www.uniprot.org/citations/9792677" target="\_blank">9792677</a>). RPS6KA5/MSK1 and RPS6KA4/MSK2 play important roles in the rapid induction of immediate-early genes in response to stress or mitogenic stimuli, either by inducing chromatin remodeling or by recruiting the transcription machinery (PubMed:<a href="http://www.uniprot.org/citations/9687510" target="\_blank">9687510</a>, PubMed:<a href="http://www.uniprot.org/citations/9792677" target="\_blank">9792677</a>). On the other hand, two other kinase targets, MAPKAPK2/MK2 and MAPKAPK3/MK3, participate in the control of gene expression mostly at the post-transcriptional level, by phosphorylating ZFP36 (tristetraprolin) and ELAVL1, and by regulating EEF2K, which is important for the elongation of mRNA during translation. MKNK1/MNK1 and MKNK2/MNK2, two other kinases activated by p38 MAPKs, regulate protein synthesis by phosphorylating the initiation factor EIF4E2 (PubMed:<a href="http://www.uniprot.org/citations/11154262" target="\_blank">11154262</a>). MAPK14 also interacts with casein kinase II, leading to its activation through autophosphorylation and further phosphorylation of TP53/p53 (PubMed:<a href="http://www.uniprot.org/citations/10747897" target="\_blank">10747897</a>). In the cytoplasm, the p38 MAPK pathway is an important regulator of protein turnover. For example, CFLAR is an inhibitor of TNF-induced apoptosis whose proteasome-mediated degradation is regulated by p38 MAPK phosphorylation. In a similar way, MAPK14 phosphorylates the ubiquitin ligase SIAH2, regulating its activity towards EGLN3 (PubMed:<a href="http://www.uniprot.org/citations/17003045" target="\_blank">17003045</a>). MAPK14 may also inhibit the lysosomal degradation pathway of autophagy by interfering with the intracellular trafficking of the transmembrane protein ATG9 (PubMed:<a href="http://www.uniprot.org/citations/19893488" target="\_blank">19893488</a>). Another function of MAPK14 is to regulate the endocytosis of membrane receptors by different mechanisms that impinge on the small GTPase RAB5A. In addition, clathrin-mediated EGFR internalization induced by inflammatory cytokines and UV irradiation depends on MAPK14-mediated phosphorylation of EGFR itself as well as of RAB5A effectors (PubMed:<a href="http://www.uniprot.org/citations/16932740" target="\_blank">16932740</a>). Ectodomain shedding of transmembrane proteins is regulated by p38 MAPKs as well. In response to inflammatory stimuli, p38 MAPKs phosphorylate the membrane-associated metalloprotease ADAM17 (PubMed:<a href="http://www.uniprot.org/citations/20188673" target="\_blank">20188673</a>). Such phosphorylation is required for ADAM17-mediated ectodomain shedding of TGF-alpha family ligands, which results in the activation of EGFR signaling and cell proliferation. Another p38 MAPK substrate is FGFR1. FGFR1 can be translocated from the

extracellular space into the cytosol and nucleus of target cells, and regulates processes such as rRNA synthesis and cell growth. FGFR1 translocation requires p38 MAPK activation. In the nucleus, many transcription factors are phosphorylated and activated by p38 MAPKs in response to different stimuli. Classical examples include ATF1, ATF2, ATF6, ELK1, PTPRH, DDIT3, TP53/p53 and MEF2C and MEF2A (PubMed:<a href="http://www.uniprot.org/citations/10330143" target="\_blank">10330143</a>, PubMed:<a href="http://www.uniprot.org/citations/9430721" target="\_blank">9430721</a>, PubMed:<a href="http://www.uniprot.org/citations/9858528" target="\_blank">9858528</a>). The p38 MAPKs are emerging as important modulators of gene expression by regulating chromatin modifiers and remodelers. The promoters of several genes involved in the inflammatory response, such as IL6, IL8 and IL12B, display a p38 MAPK-dependent enrichment of histone H3 phosphorylation on 'Ser-10' (H3S10ph) in LPS-stimulated myeloid cells. This phosphorylation enhances the accessibility of the cryptic NF-kappa-B-binding sites marking promoters for increased NF- kappa-B recruitment. Phosphorylates CDC25B and CDC25C which is required for binding to 14-3-3 proteins and leads to initiation of a G2 delay after ultraviolet radiation (PubMed:<a href="http://www.uniprot.org/citations/11333986" target="\_blank">11333986</a>). Phosphorylates TIAR following DNA damage, releasing TIAR from GADD45A mRNA and preventing mRNA degradation (PubMed:<a href="http://www.uniprot.org/citations/20932473" target="\_blank">20932473</a>). The p38 MAPKs may also have kinase- independent roles, which are thought to be due to the binding to targets in the absence of phosphorylation. Protein O-Glc-N-acylation catalyzed by the OGT is regulated by MAPK14, and, although OGT does not seem to be phosphorylated by MAPK14, their interaction increases upon MAPK14 activation induced by glucose deprivation. This interaction may regulate OGT activity by recruiting it to specific targets such as neurofilament H, stimulating its O-Glc-N-acylation. Required in mid- fetal development for the growth of embryo-derived blood vessels in the labyrinth layer of the placenta. Also plays an essential role in developmental and stress-induced erythropoiesis, through regulation of EPO gene expression (PubMed:<a href="http://www.uniprot.org/citations/10943842" target="\_blank">10943842</a>). Isoform MXI2 activation is stimulated by mitogens and oxidative stress and only poorly phosphorylates ELK1 and ATF2. Isoform EXIP may play a role in the early onset of apoptosis. Phosphorylates S100A9 at 'Thr-113' (PubMed:<a href="http://www.uniprot.org/citations/15905572" target="\_blank">15905572</a>). Phosphorylates NLRP1 downstream of MAP3K20/ZAK in response to UV-B irradiation and ribosome collisions, promoting activation of the NLRP1 inflammasome and pyroptosis (PubMed:<a href="http://www.uniprot.org/citations/35857590" target="\_blank">35857590</a>).

#### **Cellular Location**

Cytoplasm. Nucleus

#### **Tissue Location**

Brain, heart, placenta, pancreas and skeletal muscle. Expressed to a lesser extent in lung, liver and kidney

### **Anti-p38 MAPK MAPK14 Rabbit Monoclonal Antibody - Protocols**

Provided below are standard protocols that you may find useful for product applications.

### **Anti-p38 MAPK MAPK14 Rabbit Monoclonal Antibody - Images**

IHC analysis of p38 MAPK using anti-p38 MAPK antibody (M00176-1) on human brain.

p38 MAPK was detected in paraffin-embedded section. Heat mediated antigen retrieval was performed in citrate buffer (pH6, epitope retrieval solution) for 20 mins. The tissue section was blocked with 10% goat serum. The tissue section was then incubated with 1ug/ml rabbit anti-p38 MAPK Antibody (M00176-1) overnight at 4°C. Biotinylated goat anti Rabbit IgG antibody was used as secondary antibody and incubated for 30 minutes at 37°C. The tissue section was developed using Streptavidin-Biotin-Complex (SABC)(Catalog # SA1022) with DAB as the chromogen.

IF analysis of immunocytochemical section of HeLa cells using anti-p38 MAPK antibody (M00176-1)

p38 MAPK was detected in immunocytochemical section. Enzyme antigen retrieval was performed using IHC enzyme antigen retrieval reagent (AR0022) for 15 mins. The tissue section was blocked with 10% goat serum. The tissue section was then incubated with 2 µg/mL rabbit anti-p38 MAPK Antibody (M00176-1) overnight at 4 °C.

Figure 1. Western blot analysis of p38 MAPK using anti-p38 MAPK antibody (M00176-1). Electrophoresis was performed on a 5-20% SDS-PAGE gel at 70V (Stacking gel) / 90V (Resolving gel) for 2-3 hours. The sample well of each lane was loaded with 30 ug of sample under reducing conditions.

Lane 1: human Jurkat whole cell lysates,  
Lane 2: human SW620 whole cell lysates,  
Lane 3: human CACO-2 whole cell lysates,  
Lane 4: human Hela whole cell lysates,  
Lane 5: rat heart tissue lysates,  
Lane 6: rat lung tissue lysates,  
Lane 7: mouse heart tissue lysates,  
Lane 8: mouse lung tissue lysates.

After electrophoresis, proteins were transferred to a nitrocellulose membrane at 150 mA for 50-90 minutes. Blocked the membrane with 5% non-fat milk/TBS for 1.5 hour at RT. The membrane was incubated with rabbit anti-p38 MAPK antigen affinity purified monoclonal antibody (Catalog # M00176-1) at 1:500 overnight at 4°C, then washed with TBS-0.1%Tween 3 times with 5 minutes each and probed with a goat anti-rabbit IgG-HRP secondary antibody at a dilution of 1:1000 for 1.5 hour at RT. The signal is developed using an Enhanced Chemiluminescent detection (ECL) kit (Catalog # EK1002) with Tanon 5200 system. A specific band was detected for p38 MAPK at approximately 41, 38 kDa. The expected band size for p38 MAPK is at 41 kDa.

Immunohistochemical analysis of paraffin-embedded Human thyroid cancer, using the Antibody at 1:50 dilution.

Immunohistochemical analysis of paraffin-embedded Human prostate cancer, using the Antibody at 1:50 dilution.

Immunohistochemical analysis of paraffin-embedded Human astrocytoma, using the Antibody at 1:300 dilution.

Immunofluorescent analysis using the Antibody at 1:50 dilution.
