

Anti-Lambda Light Chain (B-Cell Marker) Antibody
Mouse Monoclonal Antibody
Catalog # AH13323**Specification****Anti-Lambda Light Chain (B-Cell Marker) Antibody - Product Information**

Application	WB, IHC-P, IF, FC
Primary Accession	P01701
Other Accession	449585 , 3546 , P01842
Reactivity	Human
Host	Mouse
Clonality	Monoclonal
Isotype	Mouse / IgG1, kappa
Calculated MW	12249

Anti-Lambda Light Chain (B-Cell Marker) Antibody - Additional Information**Other Names**

Bence Jones Protein; BJP; IGLC 1/2/3; Mcg Marker; Paraprotein

Application Note

WB~~1:1000
IHC-P~~N/A
IF~~1:50~200
FC~~1:10~50

Format

200ug/ml of Ab purified from Bioreactor Concentrate by Protein A/G. Prepared in 10mM PBS with 0.05% BSA & 0.05% azide. Also available WITHOUT BSA & azide at 1.0mg/ml.

Storage

Store at 2 to 8°C. Antibody is stable for 24 months.

Precautions

Anti-Lambda Light Chain (B-Cell Marker) Antibody is for research use only and not for use in diagnostic or therapeutic procedures.

Anti-Lambda Light Chain (B-Cell Marker) Antibody - Protein Information

Name IGLV1-51 {ECO:0000303|PubMed:11872955, ECO:0000303|Ref.7}

Function

V region of the variable domain of immunoglobulin light chains that participates in the antigen recognition (PubMed: <http://www.uniprot.org/citations/24600447> target="_blank">24600447). Immunoglobulins, also known as antibodies, are membrane-bound or secreted glycoproteins produced by B lymphocytes. In the recognition phase of humoral immunity, the membrane-bound immunoglobulins serve as receptors which, upon binding of a specific antigen, trigger the clonal expansion and differentiation of B lymphocytes into immunoglobulins-secreting plasma cells. Secreted immunoglobulins mediate the effector phase of

humoral immunity, which results in the elimination of bound antigens (PubMed:20176268, PubMed:22158414). The antigen binding site is formed by the variable domain of one heavy chain, together with that of its associated light chain. Thus, each immunoglobulin has two antigen binding sites with remarkable affinity for a particular antigen. The variable domains are assembled by a process called V-(D)-J rearrangement and can then be subjected to somatic hypermutations which, after exposure to antigen and selection, allow affinity maturation for a particular antigen (PubMed:17576170, PubMed:20176268).

Cellular Location

Secreted. Cell membrane

Anti-Lambda Light Chain (B-Cell Marker) Antibody - Protocols

Provided below are standard protocols that you may find useful for product applications.

Anti-Lambda Light Chain (B-Cell Marker) Antibody - Background

This MAb is specific to lambda light chain of immunoglobulin and shows no cross-reaction with lambda light chain or any of the five heavy chains. In mammals, the two light chains in an antibody are always identical, with only one type of light chain, kappa or lambda. The ratio of Kappa to Lambda is 70:30. However, with the occurrence of multiple myeloma or other B-cell malignancies this ratio is disturbed. Antibody to the lambda light chain is reportedly useful in the identification of leukemias, plasmacytomas, and certain non-Hodgkin's lymphomas. Demonstration of clonality in lymphoid infiltrates indicates that the infiltrate is malignant.
