Transcription activator that binds DNA cooperatively with DP proteins through the E2 recognition site, 5'-TTTC[CG]CGC-3' found in the promoter region of a number of genes whose products are involved in cell cycle regulation or in DNA replication (PubMed:10675335, PubMed:12717439, PubMed:17050006, PubMed:17704056, PubMed:18625225, PubMed:28992046). The DRTF1/E2F complex functions in the control of cell-cycle progression from G1 to S phase (PubMed:10675335, PubMed:12717439, PubMed:17704056). E2F1 binds preferentially RB1 in a cell-cycle dependent manner (PubMed:<a

It can mediate both cell proliferation and TP53/p53- dependent apoptosis (PubMed:<<http://www.uniprot.org/citations/8170954> target="_blank">8170954). Blocks adipocyte differentiation by binding to specific promoters repressing CEBPA binding to its target gene promoters (PubMed:<<http://www.uniprot.org/citations/20176812> target="_blank">20176812). Directly activates transcription of PEG10 (PubMed:<<http://www.uniprot.org/citations/17050006> target="_blank">17050006, PubMed:<<http://www.uniprot.org/citations/18625225> target="_blank">18625225, PubMed:<<http://www.uniprot.org/citations/28992046> target="_blank">28992046). Positively regulates transcription of RRP1B (PubMed:<<http://www.uniprot.org/citations/20040599> target="_blank">20040599).
