### STAT4 Antibody (monoclonal) (M01) - Background

The protein encoded by this gene is a member of the STAT family of transcription factors. In response to cytokines and growth factors, STAT family members are phosphorylated by the receptor associated kinases, and then form homo- or heterodimers that translocate to the cell nucleus where they act as transcription activators. This protein is essential for mediating responses

to IL12 in lymphocytes, and regulating the differentiation of T helper cells.
